

AIR HUMIDIFICATION

HOME COMFORT BY DESIGN... RIGHT IN THE FAN COIL™

- M-PAD™ feature ensures that excess moisture is removed from the mist to prevent damage and corrosion to ducts and piping.
- Controlling the relative humidity to 30-60% counteracts the discomforting effects of a dry climate, such as dry skin, cracked lips and/or sinus congestion. As well, it can protect furniture from drying and cracking and reduce static electricity.
- SEALED DRAIN™ technology constantly monitors systems for leaks, shutting off water and diverting any water that may have leaked to the drain.
- Ultrasonic module silently creates a cool mist matched to the fan speed to deliver just the right amount of humidity.
- Advanced water-treatment module combines physical filtration, ion-exchange resin and activation carbon to remove unwanted and potentially hazardous minerals and chemicals.
- This avoids potential health hazards and the mess associated with “white dust” produced by some competitive humidification systems when calcium in the incoming water is transferred into the air.
